

# On a new family of algebraically defined graphs with small automorphism group

Vladislav Taranchuk

Open University Discrete Math Seminar

November 10, 2021

## Definition

A **simple graph**  $\Gamma = \Gamma(V, E)$  is a pair, where  $V$  is the set of vertices, and  $E \subset \binom{V}{2}$  is the set of edges. We denote the fact that a vertex  $x$  is **adjacent** to a vertex  $y$  by  $x \sim y$ . Since  $\Gamma$  is simple, the above definition removes the possibility of multiple edges, directed edges, and loops. In this talk, every graph mentioned will be a simple graph.

## Definition

Let  $\Gamma$  be a graph and  $x \in V$ . Denote  $r_k(x)$  to be the number of vertices in  $\Gamma$  that are at distance  $k$  from  $x$ .

## Definition

Let  $\Gamma$  be a connected graph. The **diameter** of  $\Gamma$  is defined to be the maximum distance amongst all pairs of vertices in  $\Gamma$ .

## Definition (Algebraically Defined Graphs)

Let  $P = L = \mathbb{F}_q^m$  be two copies of the  $m$ -dimensional vector space over  $\mathbb{F}_q$  with  $q = p^e$ . Call the set  $P$  points and  $L$  lines, with the distinction in notation by  $(a) \in P$  and  $[a] \in L$ . Define  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$  to be the bipartite graph with parts  $P$  and  $L$  and with edge relation defined between them as follows: If  $(p) = (p_1, \dots, p_m) \in P$  and  $[l] = [l_1, \dots, l_m]$ , then  $(p) \sim [l]$  if and only if

$$l_2 + p_2 = f_2(l_1, p_1)$$

$$l_3 + p_3 = f_3(l_1, p_1, l_2, p_2)$$

$$\vdots$$

$$l_m + p_m = f_m(l_1, p_1, \dots, l_{m-1}, p_{m-1})$$

# Properties of algebraically defined graphs

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

# Properties of algebraically defined graphs

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

- Each point (or line) in  $\Gamma_q$  has exactly one neighbor whose first coordinate is  $x$ , for every  $x \in \mathbb{F}_q$ .

# Properties of algebraically defined graphs

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

- Each point (or line) in  $\Gamma_q$  has exactly one neighbor whose first coordinate is  $x$ , for every  $x \in \mathbb{F}_q$ . Fix a line  $\ell = [\ell_1, \ell_2, \dots, \ell_m]$  and choose any  $x \in \mathbb{F}_q$  setting  $p_1 = x$ , then:

# Properties of algebraically defined graphs

## Question

*What other families of projective planes could be constructed via  $\Gamma_q(f_2)$ ?*

## Why are these graphs interesting?

Algebraically defined graphs of the form  $\Gamma_q(f_2, f_3)$  can also give a method for constructing a generalized quadrangle (4-gon).

# Why are these graphs interesting?

Algebraically defined graphs of the form  $\Gamma_q(f_2, f_3)$  can also give a method for constructing a generalized quadrangle (4-gon).

- For all prime powers  $q = p^e$ , one can attach a tree to  $\Gamma_q(p_1\ell_1, p_1\ell_2)$  to obtain the classical generalized quadrangle.

# Why are these graphs interesting?

Algebraically defined graphs of the form  $\Gamma_q(f_2, f_3)$  can also give a method for constructing a generalized quadrangle (4-gon).

- For all prime powers  $q = p^e$ , one can attach a tree to  $\Gamma_q(p_1\ell_1, p_1\ell_2)$  to obtain the classical generalized quadrangle.

## Question

*Do there exist generalized quadrangles of odd order  $q$  that are not isomorphic to the classical generalized quadrangle?*

# Why are these graphs interesting?

Algebraically defined graphs of the form  $\Gamma_q(f_2, f_3)$  can also give a method for constructing a generalized quadrangle (4-gon).

- For all prime powers  $q = p^e$ , one can attach a tree to  $\Gamma_q(p_1\ell_1, p_1\ell_2)$  to obtain the classical generalized quadrangle.

## Question

*Do there exist generalized quadrangles of odd order  $q$  that are not isomorphic to the classical generalized quadrangle?*

Algebraically defined graphs provide one potential method for answering this question. In large part, this question motivated our research.

# Why are these graphs interesting?

Let  $\text{ex}(n, F)$  denote the largest number of edges in  $n$ -vertex graph that does not contain copy of  $F$  as a subgraph.

# Why are these graphs interesting?

Let  $\text{ex}(n, F)$  denote the largest number of edges in  $n$ -vertex graph that does not contain copy of  $F$  as a subgraph.

- It has been shown that  $\text{ex}(n, C_{2k}) \leq c_k n^{1+1/k}$  for a constant dependent on  $k$ . Bondy and Simonovits showed  $c_k = 100k$  works, and over time this constant has been improved several times, first by Verstraëte, then Pikhurko, and most recently by Bukh and Jiang who showed  $c_k = 80\sqrt{k \log k}$ .

# Why are these graphs interesting?

Let  $\Gamma = \Gamma_q(p_1 \ell_1, p_1 \ell_1 p_2 (p_1 + p_2 + p_1 p_2))$ . This family of graphs appeared in the thesis of Nassau 2021. It was checked via computer that for all odd prime powers  $q < 43$ , there do not exist functions  $f_2, f_3$  of just  $p_1$  and  $\ell_1$  such that  $\Gamma \cong \Gamma_q(f_2, f_3)$ . Though he could not prove it for any infinite sequence of  $q$ 's.

# Why are these graphs interesting?

## Question

Given  $\Gamma_q(f_2, f_3)$  where  $f_2 = f_2(p_1, \ell_1)$  and  $f_3 = f_3(p_1, \ell_1, p_2, \ell_2)$ , does there exist a function  $f'_3 = f'_3(p_1, \ell_1)$  so that  $\Gamma_q(f_2, f_3) \cong \Gamma_q(f_2, f'_3)$ ?

Let  $\Gamma = \Gamma_q(p_1 \ell_1, p_1 \ell_1 p_2 (p_1 + p_2 + p_1 p_2))$ . This family of graphs appeared in the thesis of Nassau 2021. It was checked via computer that for all odd prime powers  $q < 43$ , there do not exist functions  $f_2, f_3$  of just  $p_1$  and  $\ell_1$  such that  $\Gamma \cong \Gamma_q(f_2, f_3)$ . Though he could not prove it for any infinite sequence of  $q$ 's.

## Theorem (Lazebnik and T. 2021+)

Let  $p$  be an odd prime with  $p \equiv 1 \pmod{3}$ . Let  $f_2 = f_2(p_1, \ell_1)$  and  $f_3 = f_3(p_1, \ell_1)$  be functions of  $p_1$  and  $\ell_1$ . Then  $\Gamma_q(f_2, f_3) \not\cong \Gamma$ .

Consider any graph of the form  $\Gamma_q(f_2(p_1, l_1), f_3(p_1, l_1))$ . Observe that since

$$p_2 + l_2 = f_2(p_1, l_1)$$

$$p_3 + l_3 = f_3(p_1, l_1)$$

# Results and methods

Consider any graph of the form  $\Gamma_q(f_2(p_1, l_1), f_3(p_1, l_1))$ . Observe that since

$$p_2 + l_2 = f_2(p_1, l_1)$$

$$p_3 + l_3 = f_3(p_1, l_1)$$

then for all  $a, b \in \mathbb{F}_q$ , the function  $t_{a,b}$  where

$$t_{a,b}[l_1, l_2, l_3] = [l_1, l_2 + a, l_3 + b]$$

$$t_{a,b}(p_1, p_2, p_3) = (p_1, p_2 - a, p_3 - b)$$

is an automorphism of  $\Gamma_q$ . Meaning,  $q^2 \leq |\text{Aut}(\Gamma_q)|$ .

For the rest of this talk, let  $\Gamma = \Gamma_q(p_1 l_1, p_1 l_1 p_2 (p_1 + p_2 + p_1 p_2))$ .

## Results and methods

For the rest of this talk, let  $\Gamma = \Gamma_q(p_1 l_1, p_1 l_1 p_2 (p_1 + p_2 + p_1 p_2))$ .

For odd prime powers  $q < 43$ , Nassau found via computation that  $|\text{Aut}(\Gamma)| = q$ . He conjectured that this holds true for for all  $q$ .

## Results and methods

For the rest of this talk, let  $\Gamma = \Gamma_q(p_1 \ell_1, p_1 \ell_1 p_2 (p_1 + p_2 + p_1 p_2))$ .

For odd prime powers  $q < 43$ , Nassau found via computation that  $|\text{Aut}(\Gamma)| = q$ . He conjectured that this holds true for all  $q$ .

**Theorem (Lazebnik and T. 2021+)**

*Let  $p$  be an odd prime with  $p \equiv 1 \pmod{3}$ . If  $\Gamma$  is defined over  $\mathbb{F}_p$ , then  $|\text{Aut}(\Gamma)| = p$ .*

# Results and methods

For the rest of this talk, let  $\Gamma = \Gamma_q(p_1 \ell_1, p_1 \ell_1 p_2 (p_1 + p_2 + p_1 p_2))$ .

For odd prime powers  $q < 43$ , Nassau found via computation that  $|\text{Aut}(\Gamma)| = q$ . He conjectured that this holds true for all  $q$ .

**Theorem (Lazebnik and T. 2021+)**

*Let  $p$  be an odd prime with  $p \equiv 1 \pmod{3}$ . If  $\Gamma$  is defined over  $\mathbb{F}_p$ , then  $|\text{Aut}(\Gamma)| = p$ .*

The proof is broken into two main parts:

For the rest of this talk, let  $\Gamma = \Gamma_q(p_1 l_1, p_1 l_1 p_2 (p_1 + p_2 + p_1 p_2))$ .

For odd prime powers  $q < 43$ , Nassau found via computation that  $|\text{Aut}(\Gamma)| = q$ . He conjectured that this holds true for for all  $q$ .

**Theorem (Lazebnik and T. 2021+)**

*Let  $p$  be an odd prime with  $p \equiv 1 \pmod{3}$ . If  $\Gamma$  is defined over  $\mathbb{F}_p$ , then  $|\text{Aut}(\Gamma)| = p$ .*

The proof is broken into two main parts:

- The first part works for prime powers  $q \equiv 1 \pmod{3}$ .

For the rest of this talk, let  $\Gamma = \Gamma_q(p_1 \ell_1, p_1 \ell_1 p_2 (p_1 + p_2 + p_1 p_2))$ .

For odd prime powers  $q < 43$ , Nassau found via computation that  $|\text{Aut}(\Gamma)| = q$ . He conjectured that this holds true for all  $q$ .

## Theorem (Lazebnik and T. 2021+)

*Let  $p$  be an odd prime with  $p \equiv 1 \pmod{3}$ . If  $\Gamma$  is defined over  $\mathbb{F}_p$ , then  $|\text{Aut}(\Gamma)| = p$ .*

The proof is broken into two main parts:

- The first part works for prime powers  $q \equiv 1 \pmod{3}$ .
- The second part works when  $q$  is prime, under the assumption of the first part.

- Nassau showed that
  - $r_3([0, 1, 0]) = q^3 - 4q^2 + 9q - 8$
  - $r_3([0, 0, 0]) = q^3 - 4q^2 + 8q - 6$

- Nassau showed that
  - $r_3([0, 1, 0]) = q^3 - 4q^2 + 9q - 8$
  - $r_3([0, 0, 0]) = q^3 - 4q^2 + 8q - 6$
- We show that that for all vertices  $x$  in  $\Gamma$  that are not of the form  $[0, 1, r]$  or  $[0, 0, r]$

$$r_3(x) < r_3([0, 0, 0])$$

# Proof Outline

- Nassau showed that
  - $r_3([0, 1, 0]) = q^3 - 4q^2 + 9q - 8$
  - $r_3([0, 0, 0]) = q^3 - 4q^2 + 8q - 6$
- We show that that for all vertices  $x$  in  $\Gamma$  that are not of the form  $[0, 1, r]$  or  $[0, 0, r]$

$$r_3(x) < r_3([0, 0, 0])$$

- Therefore, for all  $\phi \in \text{Aut}(\Gamma)$ :
  - $\phi[0, 1, r] = [0, 1, s]$
  - $\phi[0, 0, r] = [0, 0, t]$

# Proof Outline

Recall that each point (or line) in  $\Gamma$  has exactly one neighbor whose first coordinate is  $x$ , for every  $x \in \mathbb{F}_q$ .

# Proof Outline

Recall that each point (or line) in  $\Gamma$  has exactly one neighbor whose first coordinate is  $x$ , for every  $x \in \mathbb{F}_q$ .

Vertices at distance three of  $[A, B, 0]$  can be described as follows:

$$[A, B, 0] \sim (a, \star, \star) \sim [x, \star, \star] \sim (b, c, P_{A,B}(b, c; a)/(b - a))$$

where  $P_{A,B}(b, c; a)$  is a 4th degree polynomial in  $a$ .

# Proof Outline

Recall that each point (or line) in  $\Gamma$  has exactly one neighbor whose first coordinate is  $x$ , for every  $x \in \mathbb{F}_q$ .

Vertices at distance three of  $[A, B, 0]$  can be described as follows:

$$[A, B, 0] \sim (a, \star, \star) \sim [x, \star, \star] \sim (b, c, P_{A,B}(b, c; a)/(b - a))$$

where  $P_{A,B}(b, c; a)$  is a 4th degree polynomial in  $a$ . In particular:

$$\begin{aligned} P_{A,B}(b, c; a) = & A^2(Ab - B - c)a^4 \\ & + A(A - 2B + 1)(Ab - B - c)a^3 \\ & - B(2A - B + 1)(Ab - B - c)a^2 \\ & - (Ac^2b^2 - AB^2b + Ac^2b + ACb^2 + B^3 + B^2c)a \\ & + cb(cb + c + b)(c + B). \end{aligned}$$

# Proof Outline

The set of all distance three neighbors of lines of the form  $[A, B, 0]$  is given by

$$\left\{ \left( b, c, \frac{P_{A,B}(b, c; a)}{b - a} \right) : a, b, c \in \mathbb{F}_q, c \neq Ab - B, a \neq b \right\}.$$

# Proof Outline

The set of all distance three neighbors of lines of the form  $[A, B, 0]$  is given by

$$\left\{ \left( b, c, \frac{P_{A,B}(b, c; a)}{b - a} \right) : a, b, c \in \mathbb{F}_q, c \neq Ab - B, a \neq b \right\}.$$

To bound  $r_3([A, B, 0])$  we need to bound the range of  $P_{A,B}(b, c; a)/(b - a)$ .

# Proof Outline

The set of all distance three neighbors of lines of the form  $[A, B, 0]$  is given by

$$\left\{ \left( b, c, \frac{P_{A,B}(b, c; a)}{b - a} \right) : a, b, c \in \mathbb{F}_q, c \neq Ab - B, a \neq b \right\}.$$

To bound  $r_3([A, B, 0])$  we need to bound the range of  $P_{A,B}(b, c; a)/(b - a)$ .

**Theorem (Lazebnik and T. 2021+)**

*Let  $q \equiv 1 \pmod{3}$  be an odd prime power, then the rational function*

$$x^3 + c_2x^2 + c_1x + \frac{c_{-1}}{x}$$

*with  $c_2, c_1, c_{-1} \in \mathbb{F}_q$  has range with size at most  $q - 3$ .*

# Proof Outline

Note that for all  $x \in \mathbb{F}_q$ ,  $x \neq 0$ :

$$x^3 + c_2x^2 + c_1x + \frac{c_{-1}}{x} = x^3 + c_2x^2 + c_1x + c_{-1}x^{q-2}.$$

# Proof Outline

Note that for all  $x \in \mathbb{F}_q$ ,  $x \neq 0$ :

$$x^3 + c_2x^2 + c_1x + \frac{c_{-1}}{x} = x^3 + c_2x^2 + c_1x + c_{-1}x^{q-2}.$$

## Theorem (Hermite's Criterion)

*Let  $q = p^e$  be a prime power. If  $p(x)^t \pmod{x^q - x}$  has degree  $q - 1$  for some  $t \not\equiv 0 \pmod{p}$ , then  $p(x)$  is not a permutation polynomial of  $\mathbb{F}_q$ .*

# Proof Outline

Note that for all  $x \in \mathbb{F}_q$ ,  $x \neq 0$ :

$$x^3 + c_2x^2 + c_1x + \frac{c_{-1}}{x} = x^3 + c_2x^2 + c_1x + c_{-1}x^{q-2}.$$

## Theorem (Hermite's Criterion)

*Let  $q = p^e$  be a prime power. If  $p(x)^t \pmod{x^q - x}$  has degree  $q - 1$  for some  $t \not\equiv 0 \pmod{p}$ , then  $p(x)$  is not a permutation polynomial of  $\mathbb{F}_q$ .*

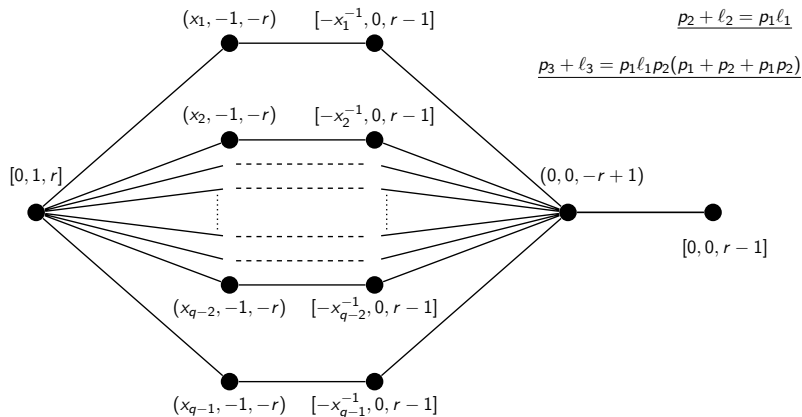

## Theorem (Wan 1993)

*If a polynomial  $p(x)$  of degree  $n$  is not a permutation polynomial of  $\mathbb{F}_q$ , then*

$$|\text{Rng}(p(x))| \leq q - \left\lceil \frac{q-1}{n} \right\rceil.$$

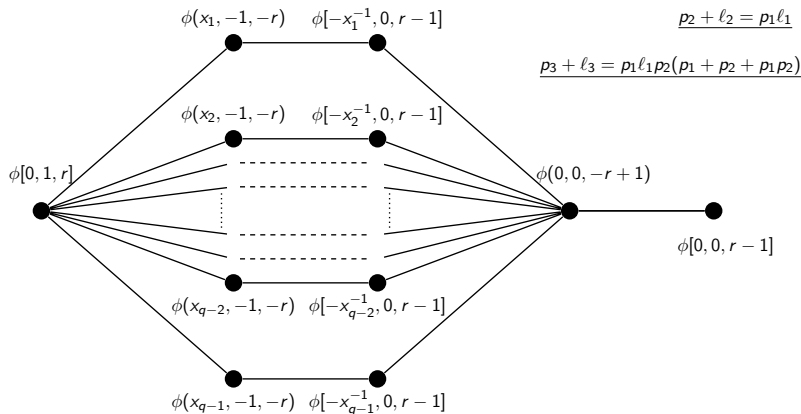

# Proof Outline

Observe the following structure in  $\Gamma$ .

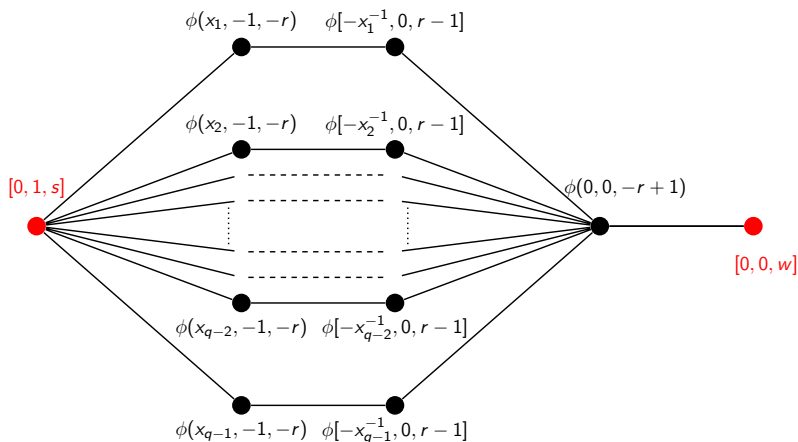

# Proof Outline

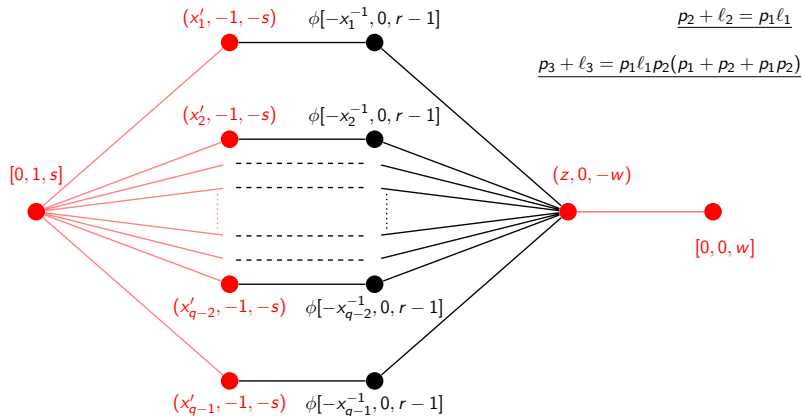

Let  $\phi \in \text{Aut}(\Gamma)$  and apply  $\phi$ . Suppose  $\phi[0, 1, r] = [0, 1, s]$  and  $\phi[0, 0, r - 1] = [0, 0, w]$ .
